ACKNOWLEDGEMENTS

This research is sponsored by the Commonwealth of Kentucky, which designated the Urban Studies Center as the State's official source of demographic research and service. It was produced by the Center's Population Studies Program directed by Michael Price. Special acknowledgements are due to several support staff whose collective efforts made this report possible. They are Tom Sawyer, Sam Samnick, and Al Nash for research assistance; Brian Swett and Tony Biggs for computer support; and Barbara Farris, Betsy Jones, Kathy Smith, and Paige Gottlieb for report production.

KENTUCKY POPULATION PROJECTION SERIES

This report is the latest in a series of population forecasts produced by the Urban Studies Center to be used uniformly in State policy development and planning. The Center's Population Studies Program analyzes demographic trends through the use of census data, vital statistics, and other administrative records. Population projections are revised and published periodically to keep pace with demographic patterns emerging at the national, state, and local levels.

These projections are the first to reflect trends which have emerged since the taking of the 1980 Census. Annual population estimates from 1980 to 1983 for the state and counties, produced by the Urban Studies Center in conjunction with U.S. Bureau of the Census, were used to monitor recent trends and to revise the assumptions for projected population growth.

The 1980 Census counts, 1982 estimates, and projections for 1985, 1990, 1995, 2000, and 2020 are reported for the state, its 15 Area Development Districts, and its 120 counties. Populations are broken down by gender and age in five year cohorts through 85 years old and over. Projections and estimates represent mid-year (July 1) populations. Population pyramids for 1980, 1990, and 2000 also are presented.

In addition, population projections are available on an annual basis, 1983 to 2020, by single year of age and two racial categories, white and nonwhite. To obtain customized projections in print-out form or on computer tape, contact the State Data Center, Urban Studies Center, University of Louisville, Louisville, KY 40292 or phone 502-588-6626.

DESCRIPTIVE SUMMARY

Kentucky's population is expected to increase by approximately 400,000 persons during the 1980's. This represents a growth rate of 11.0 percent compared to the 13.7 percent growth experienced from 1970 to 1980. Growth should continue at the same pace during the 1990's increasing by 10.9 percent. By the end of the century, the state's population will have reached 4.5 million.

From 1980 to 1982 the state grew by only 0.7 percent. This slow growth resulted from net out-migration which counterbalanced natural increase, the excess of births over deaths. However, in 1983 net migration appeared to have equalized as the in and out flow of migrants balanced each other out. Net in-migration for the state is assumed to occur for the remainder of the decade, but not at the levels experienced during the 1970's. Net in-migration is expected to result in approximately four percent growth from 1980 to 1990.

Natural increase, on the other hand, will result in approximately seven percent growth in the 1980's. Birth rates are expected to rise from the historically low levels of the previous decade. The number of women of childbearing age also will rise significantly during the 1980's with the aging of the "baby boomers." Many women who delayed childbearing during the 1970's are expected to have babies. Moreover, death rates should decrease as life expectancy continues to rise.

Age composition is shifting as the number of older persons increases faster than younger age groups. The state's median age in 1980 was 29.1 years. It is projected to rise to 32.0 years in 1990, 35.4 years in 2000, and 39.8 years in 2020. Persons 65 years old and over will number approximately 631,500 by the year 2000, an increase of 54.1 percent from 1980. Over the

next two decades, their proportion of the total population will rise from 11.2 to 14.0 percent. However, the number of persons under 20 years old will increase over the same period by only 3.8 percent as their proportion falls from 33.6 to 28.3 percent. The working age population aged 20-64 years will increase by 28.4 percent and remain in the majority. Their proportion will rise from 55.2 to 57.7 percent.

Nonmetropolitan areas are expected to grow twice as fast as metropolitan areas following a trend which emerged in the 1970's. Nonmetropolitan counties grew by 1.0 percent from 1980 to 1982 compared to only 0.4 percent for metropolitan counties. Over the next two decades, metropolitan areas will increase their populations by 15.7 percent and nonmetropolitan areas by 29.2 percent assuming current boundary designations. By the end of the century, 56.9 percent of the state's population will be living in nonmetropolitan areas.

Barren River and Big Sandy will grow fastest in this decade among Area Development Districts increasing by 20.2 and 22.2 percent, respectively. Kentuckiana ADD will grow slowest at 4.3 percent. Warren will be the fastest growing county at 39.7 percent, an increase of over 28,000 from 1980 to 1990. In addition to Warren, seven counties--Oldham, Bullitt, Martin, Boone, Jessamine, Laurel, and Powell--are expected to grow by at least 25.0 percent. However, five counties--Carlisle, Hickman, Washington, Campbell, and Fulton--will decline in population size. Summaries of population projections for the state and Area Development Districts are shown in Table 1 and for the state and counties in Table 2.

METHODOLOGY

A cohort-component model is used to project the household population and the group quarters population aged 65 years and over in each county. The group quarters population aged under 65 years is held constant from the base year and added to the population projected by the model to obtain the total projected population. Projections are based from July 1, 1982 estimates produced by the U.S. Bureau of the Census and the Urban Studies Center (U.S. Department of Commerce, 1984). The model produces annual mid-year projections by using 1) survival rates to adjust for annual mortality; 2) age-specific fertility rates for the survived female population; and 3) net migration rates to adjust the population derived through "natural change."

Projected survival rates are the most recent published by Census Bureau for the nation (U.S. Department of Commerce, 1983). Mortality in Kentucky historically has been higher than national averages, particularly in the case of infant deaths. Recently, however, there has been a convergence between national and state death rates. It is assumed that survivorship in the state will increase according to national projections. Table 3 presents a summary of survival rates by age, gender and race used in the model. These rates are based on projections of population in 5-year age groups assuming no net migration, but reflect projected survival rates by single year of age and the age distribution within each age group. Rates are increased annually until the year 2000, then held constant through 2020.

Projected age-specific fertility rates are divided into five categories as shown in Table 4. They are white low fertility, white moderate fertility, white high fertility, nonwhite fertility, and extremely high fertility. Levels of white fertility are determined by historical patterns shown for

Table 3. Projected Ten-Year Survival Rates by Age, Gender, and Race 1980-1990, 1990-2000.

counties in relation to national patterns. Ninety-nine of the 120 counties have birth rates consistently above national rates. Fertility is moderate, consistent with national rates, in ten counties and below national birth rates in nine counties. White fertility is assumed to increase slightly from the historical lows recorded during the 1970's until 1995, then decline. Nonwhite fertility is higher than white fertility, particularly for females under 25 years, but is projected to converge towards national rates. In Christian and Hardin Counties fertility is extremely high for all races. It is associated with the location of major military installations.

Net migration rates for counties are specific to age in five year groupings and gender. For counties with more than 5,000 nonwhite population, rates also are specific to white and nonwhite racial categories. Migration patterns at the county level fluctuate considerably in the short term and therefore are difficult to project. County net migration rates by age, gender, and race from 1970 to 1980 (Price, 1983) were adjusted according to annual migration patterns shown from 1980 to 1983. In most counties these adjustments resulted in the lowering of net migration impacts. In general "negative" migration rates were held constant and "positive" rates were reduced. Adjusted rates are held constant from 1983 to 1990, then are converged half way toward zero net migration over the next ten years, and finally held constant until 2020.

Table 4. Projected Fertility Rates for Kentucky.

Projection Period	Total Fertility Rate	Age-Specific Fertility Rates							
		10 to 14 Years	15 to 19 Years	20 to 24 Years	25 to 29 Years	30 to 34 Years	35 to 39 Years	40 to 44 Years	45 to 49 Years
